**Asthma** is a chronic respiratory disease associated with airway obstruction, with recurrent attacks of paroxysmal dyspnea, and wheezing due to spasmodic contraction of the bronchi. (ICD 9 code 493.2)

**Allergy** is a hypersensitivity to an agent caused by an immunologic response to an initial exposure. (ICD 9 code 995.3)

**Prevalence**
- Asthma affects 9.3% of the population, higher in females and African-Americans

**Manifestations**

**Clinical**
- Constriction of bronchi, coughing, wheezing, chest tightness, and shortness of breath

**Oral**
- Increased caries risk, enamel defects
- Increased gingivitis and periodontal disease risk; and more calculus
- Higher rates of malocclusion and increased: overjet, overbite, posterior crossbite; high palatal vault
- Oral candidiasis, xerostomia, decreased salivary flow rate and salivary pH

**Other Potential Disorders/Concerns**
- none

**Management**

**Medication**

**Sedation**
- Hydroxyzine and benzodiazepines recommended; avoid narcotics and barbiturates due to their histamine releasing properties → bronchospasm and potentiated allergic response.

**Intravenous sedation**
- Use extreme caution due to limited control of the airway.

**Avoid**
- Aspirin, other salicylates and NSAIDS (due to allergies) may provoke a severe exacerbation of bronchoconstriction; use acetaminophen.

**Behavioral**
- Stress-management techniques; may use nitrous oxide in mild to moderate asthmatics after medical consultation. Anxiety can cause acute exacerbation.
Children with Respiratory Disorders: Asthma and Allergies continued

Dental Treatment and Prevention
- Assess child’s risk of acute exacerbation/anaphylaxis during dental treatment prior to examination. Ask detailed questions about asthma frequency (>2/week indicates poor control) and severity (previous hospitalization or emergency room visit), triggering agents, and management/medications (more medication indicates poorer control).
- Confirm that the child has taken most recent dose of medication.
- Administration of a bronchodilator as premedication before dental treatment may be useful. Verify bronchodilator and EpiPen are readily accessible.
- Reschedule symptomatic children (coughing, wheezing, etc.) if appropriate.
- Stimulating procedures (e.g. surgery, extractions, etc.) may provoke attack.
- Use of Nitrous Oxide analgesia is appropriate for patients with mild to moderate asthma, but is contraindicated during episodes of wheezing. Caution is advised for patients with severe asthma. Medical consult may be indicated.
- Some reports indicate that dental materials may exacerbate asthma including dentifrices, fissure sealants, tooth enamel dust, methyl methacrylate, fluoride trays, and cotton rolls.
- Have supplemental oxygen available during treatment in case of acute asthmatic exacerbation.
- Monitor breathing and avoid obstructing airway. Rubber dam will decrease chance of particulate inhalation.
- Consider prescribing fluoride rinses to use at home to reduce caries incidence especially for children using β2 agonists.
- Assess orthodontic needs for malocclusion early.

Allergy
- Severe latex allergy: Consider all sources of latex including gloves, rubber dams, prophylaxis cups, and orthodontic elastics. Latent allergens in air may cause anaphylactic symptoms.
- Be aware that sinus pressure on maxillary nerves can cause referred tooth pain in children with allergies.

Emergency Management – Discontinue dental procedure, follow standard protocols:

Asthma
- Administer β2 agonist via inhaler or nebulizer, and administer oxygen via face mask or nasal hood.
- If symptoms worsen or do not improve, administer epinephrine (1:1000 solution, 0.01 mg/kg body weight) subcutaneously and alert emergency medical services.
- In cases of anaphylaxis: epinephrine 0.01 mg/kg body weight (max 0.5 ml) may repeat q 15 minutes x 2 doses.

Allergy
- In cases of milder allergic reaction: Diphenhydramine 1–2 mg/kg (max. 50 mg).
- If symptoms worsen or do not improve, administer epinephrine (1:1000 solution, 0.01 mg/kg body weight) subcutaneously and alert emergency medical services.
- Children with severe allergy may carry an EpiPen for immediate administration of epinephrine.
- In cases of anaphylaxis: Epinephrine 0.01 mg/kg body weight (max 0.5 ml) may repeat q 15 minutes x 2 doses.

Look for signs of physical abuse during the examination. Note findings in chart and report any suspected abuse to Child Protective Services, as required by law. Abuse is more common in children with developmental disabilities and often manifests in oral trauma.
